0 Bibliography

Figure 0.1: The authors left to right for each row: Ralph Baierlein, Katherine Blundell, Steve Blundell, Roger Bowley, Mike Glazer, Franz Mandl, Brian Pippard, Fred Reif, Mariana Sanchez, Colin Thompson, Gregory Wannier and Justin Wark.

The book I like the most in terms of physical understanding is available electronically from the Library: *Thermal physics* by Ralph Baierlein. It has many interesting and revealing asides and is very clear on some subtle points.

Another quite appealing book which is available electronically is *Concepts in thermal physics* by Stephen Blundell and Katherine Blundell.

One of the Manchester series, available electronically: *Statistical physics* by Franz Mandl

A bare bones treatment (but not electronic unfortunately) is *Statistical mechanics : a survival guide* Mike Glazer and Justin Wark.

Another book which is clear, and more thorough than Glazer and Wark. *Introductory statistical*

mechanics by Roger Bowley and Mariana Sánchez.

Clear and perhaps a little advanced: *Fundamentals of statistical and thermal physics* Fred Reif.

More advanced books, which mostly include a treatment of phase transitions:

An old but very good book straddles undergraduate/postgraduate level is *Statistical physics* by Gregory Wannier.

A short but excellent book on thermodynamics *Elements of classical thermodynamics for advanced students of physics* by A. Brian Pippard.

The definitive book on thermodynamics (2nd edition) *Thermodynamics : an introduction to the physical theories of equilibrium thermostatics and irreversible thermodynamics* by Herbert Callen.

A very clear but quite mathematical book on classical statistical mechanics *Classical equilibrium statistical mechanics* by Colin Thompson.

An encyclopaedic coverage of statistical mechanics, with subtle points covered carefully, is *Statistical Mechanics*, Raj Pathria, fourth edition, Academic press (2021), available as an e-book.
